

Title:- Exploratory Data Analysis Report – Sales 2014

Introduction:- This report presents an Exploratory Data Analysis (EDA) of a retail company's 2014 sales data. The objective is to uncover patterns in sales performance, discount efficiency, shipping costs, and monthly trends to support future business decisions.

key finding:-

- 1.Top Salesperson: Richard achieved the highest Total Sales and Sales Score based on volume and value.
- 2.Sales Trends: January, December, and March were peak sales months, while May, June, and November saw the lowest sales.
- 3.Discount Strategy: Very weak correlation between discount and sales (-0.0361).Orders marked 'Low' and 'Not Specified' received higher discounts (6–7%) and can be targeted further.
- 4.Shipping Cost: Delivery Truck and Jumbo Containers are the most expensive options.

Summary & Recommendation(2014 Sales):-The 2014 sales analysis reveals that Richard was the top-performing salesperson, based on both total sales

and a custom Sales Score metric that accounts for order volume. Monthly trends show peak sales in January (5.06M), December (4.09M), and March (4.04M), while May, June, and November experienced the lowest sales. The correlation between discount and sales is weak (-0.0361), indicating that blanket discounts are ineffective. However, targeted discounts of 6–7% on 'Low' and 'Not Specified' priority orders may improve results.

Shipping analysis shows Regular Air is most used, while Delivery Truck and Jumbo containers are the most expensive.

In November 2015, launch a "Winter Discount Campaign" offering 6–7% discounts on low-priority orders. Pair this with cost-effective shipping methods like Regular Air and Small Boxes to reduce delivery expenses. This targeted approach will help boost sales in slow months while preserving profitability.
